Instrument management: the overlooked key to successful color management.

Instruments are manufactured and calibrated to meet performance specs when they leave the factory. But even the best instruments don't stay on spec forever. Over time, instruments drift. And while it may be invisible to the naked eye, it means your devices ... and those of your supply chain partners ... may introduce uncertainties into your QC process. So the color's off. Samples don't match. It takes more redos to get the color right. Which slows the approval process (while increasing its cost), delays time-to-market, compromises color quality, turns off buyers, and eats directly into profits.

In today's fast paced world, it's often time consuming and costly to administer and maintain the traditional manual methods of instrument management.

The solution: NetProfiler Web-enabled instrument management software.

It helps you and your suppliers achieve color perfection – at speeds only the Internet can deliver. So you can:

- Ensure accurate color measurement
- Speed the color approval process
- Prove that colors are within tolerance
- Reduce rejects and scrap
- Improve profitability and customer satisfaction

Creates, stores and manages profiles for every color instrument in your facility.

NetProfiler consists of software and certified standards. Through the Internet, NetProfiler accesses our NetProfiler website to create and manage the profiling of each instrument, based on our standards lab. The certified standards are measured, a file is sent via the Internet and compared to the stored virtual standards, returning an instrument profile.

You can run all your instruments, at all of your locations worldwide, against the certified standards as often as you like to ensure instruments perform accurately. Reports show you the performance and trends of every instrument in your global color management network.

Sophisticated remote diagnostics find and fix problems fast – without time delays of service calls. Connected to the Internet, NetProfiler acts as a constant sentinel, monitoring all the spectrophotometers throughout your supply chain. It filters out typical problems that can cause instrument drift, to keep your measurement devices running accurately at all times.

Improve quality of measurements on a regular basis.

With our patented NetProfiler system, you can automatically test, measure and profile your instruments, remotely over the Internet, to GretagMacbeth color standards – it's as easy as logging-on with your Internet Service Provider.

NetProfiler eliminates the need to wait for a technician to certify your GretagMacbeth spectrophotometers on-site. You reduce service requirements while maintaining your spectrophotometers at or near factory original specifications. So you can have confidence in the color measurements you take. And, having NetProfiler installed enables you to attain the desired quality control (QC) certifications on your color measurement systems.

Gain inter-instrument agreement...beyond a shadow of a doubt.

Whenever a spectrophotometer drifts even the slightest degree off spec, a NetProfiler run will see the problem and fix it instantly.

By making sure all instruments are measuring color accurately and to the same standard, NetProfiler can help supply chains achieve an unprecedented degree of color consistency.

Part of a complete integrated solution for color management.

Only one company, GretagMacbeth, provides a comprehensive, integrated, single-source solution for measuring, communicating and simulating color in all phases of your operations. With NetProfiler, you'll meet customer color requirements with an ease and consistency like never before.

For more information and a free, no-obligation demonstration of NetProfiler, visit www.netprofiler.org. Or contact your GretagMacbeth representative today.

Look for the industry's newest mark of color perfection. "NetProfiled" is your guarantee of accurate color consistency every time, everywhere.
